PREFACE

The APEC Energy Statistics 2015 consists of the following chapters:

1. Background information on APEC energy statistics
2. Overview of APEC energy situation
3. Member economy tables

The statistics cover the 21 APEC member economies, i.e. Australia; Brunei Darussalam; Canada; Chile; People's Republic of China; Hong Kong, China; Indonesia; Japan; Republic of Korea; Malaysia; Mexico; New Zealand; Papua New Guinea; Peru; The Republic of the Philippines; The Russian Federation; Singapore; Chinese Taipei; Thailand; United States and Viet Nam.

Chapter 1 describes the methodology for collecting and standardising the energy data and for producing the secondary data such as the energy balances and other tables. The preparation of socio-economic data is also explained.

Chapter 2 provides an analysis of energy demand and supply in the APEC region and contains figures and tables showing trends of energy demand and supply.

Chapter 3 consists of annual tables of each member economy. The annual tables contain energy balance tables for 2015 and 2014 and Energy Prices for 2015. The annual tables also include major energy indicators such as primary energy supply, final energy consumption, demand and supply by energy sources as well as major economic indicators such as population, GDP, balance of payments, foreign exchange rate, purchasing power parity, price indices and so on. These tables cover the data from 1990 to 2015. The objective is to report the most recently updated data.

APEC Energy Statistics 2015 is derived from the APEC energy database, the purpose of which is to establish a comprehensive and consistent energy database within the APEC region. This database will be used to assist in the identification of significant trends in energy supply and demand consistent with projects and priorities under the APEC Energy Working Group. It is prepared in close cooperation with member economies.

Inquiries about the data should be addressed to the Asia Pacific Energy Research Centre (APEREC).

1 Background information on APEC energy statistics

Data collection in APEC started in 1991 with the creation of an expert group on energy data and analysis under the Energy Working Group (EWG). This is in consideration of the importance of energy data collection for enhanced energy security and environmental sustainability in the APEC region. The expert group designated the Energy Data and Modeling Centre (EDMC) of the Institute of Energy Economics, Japan (IEEJ) as coordinating agency (CA) with the role of secretariat and implementer of data collection and maintenance of the APEC energy database. The role of CA was transferred to the Asia Pacific Energy Research Centre (APEREC) in 2015. The CA compiled energy data as far back as 1970 from the 21 member economies depending on data availability. The APEC Energy Statistics was published annually since 1993 and this year's publication is the 25th edition.

This publication consists of energy data submitted by each member economy as well as socio-economic data collected by the CA for this APEC activity. The energy balance tables, which give detailed description of all energy products and flows, and other tables (primary energy supply, final energy consumption, etc.) included in the statistics, are secondary data compiled by APEREC.

Energy data

APEC member economies regularly submit energy demand and supply data to the CA. These data are called "original data". Details for collection of the data are given below:

Collection format for original energy data

Most of the items found in the APEC energy statistics are based on data submitted by the APEC member economies using a set of questionnaires for oil, coal,

natural gas, electricity and heat, as well as new and renewable energy (NRE). These questionnaires were developed in 2005 for the collection of annual data for the year 2004. These are simplified forms of the annual energy questionnaires of the International Energy Agency (IEA) through the harmonisation efforts of the CA with the IEA. Tables 1-1a and 1-1b show the energy products and flows to be reported in the questionnaires. The definition of energy products and flows can be found in the Appendices.

Using the reporting format of the APEC annual energy questionnaires, the member economies submitted the following information:

- Supply and demand information for specific types of energy products
- Power generating capacity by type of power plants
- Demand and supply information of NRE

The data are reported in the following required units:

Coal and Solid Coal Products	1000 Metric Tons
Gaseous Coal Products	10 ¹⁰ kcal (gross)
Oil and Oil Products	1000 Metric Tons
Natural Gas	Million Cubic Meters
LNG	1000 Metric Tons
Solid and Liquid Bio-fuels	1000 Metric Tons
Biogas	10 ¹⁰ kcal (gross)
Electricity (including renewable)	GWh
Heat	10 ¹⁰ kcal (gross)

With regard to calorific values (both gross and net), the required units are the following:

Coal, Oil, NRE	kcal/kg
Natural Gas	kcal/cubic meter

Power generating capacity data are reported in megawatt (MW).

Table 1.1a • Energy products in the APEC energy database

Coal	Petroleum Products	Hydro
Coking coal	Gasoline	Nuclear
Other bituminous coal	Motor gasoline	New and renewable energy
Sub-bituminous coal	Aviation gasoline	Geothermal electricity
Anthracite	Naphtha	Solar photovoltaic
Lignite	Jet fuel	Tide, wave and ocean
Peat	Gasoline type jet fuel	Wind
Coal products	Kerosene type jet fuel	Geothermal heat
Coke oven coke	Other kerosene	Solar heat
Coke oven gas	Gas/diesel oil	Wood straw pellets/briquettes
Blast furnace gas	Fuel oil	Fuelwood
Oxygen steel furnace gas	LPG	Wood waste
Patent fuel	Refinery gas	Bagasse
Coal tar	Ethane	Rise husks
BKB/PB	White spirit SBP	Straw
Gas works gas	Lubricants	Charcoal
Crude Oil & NGL	Bitumen	Other vegetal and agricultural wastes
Crude oil	Paraffin waxes	Other primary solid biomass
Natural gas liquids	Petroleum coke	Biogases
Refinery feedstocks	Other petroleum products	Industrial wastes
Additives / oxygenates	Gas	Municipal solid wastes
Other hydrocarbons	Natural gas	Liquid biofuels
	LNG	Electricity
		Heat

Table 1.1b • Energy flows in the APEC energy database

Indigenous production	Total transformation sector	Total final energy consumption
Imports	Main activity producer	Industry sector
Exports	Electricity plants	Iron and steel
International marine bunkers	CHP plants	Chemical including petrochemicals
International aviation bunkers	Heat plants	Non-ferrous metals
Stock changes	Autoproducer	Non-metallic minerals
Total primary energy supply	Electricity plants	Transportation equipment
Transfers	CHP plants	Machinery
Recycled products	Heat plants	Mining and quarrying
Inter-product transfers	Gas Processing	Food, beverages and tobacco
Products transferred	Gas works	Pulp, paper and printing
Gas separation	Liquefaction	Wood and wood products
	Re-gasification	Construction
	Natural gas blending plants	Textiles and leather
	Gas-to-liquid plants	Non-specified Industry
	Refineries	Transport sector
	Coal transformation	Domestic air transport
	Coke ovens	Road
	Blast furnaces	Rail
	Patent fuel plants	Inland waterways
	BKB/PB plants	Pipeline transport
	Liquefaction (coal to oil)	Non-specified transport
	Petrochemical industry	Other sector
	Biofuel processing	Commerce and public services
	Charcoal processing	Residential
	Non-specified transformation	Agriculture
	Losses and own-use	Fishing
	Own-use	Non-specified others
	Transmission and distribution losses	Non-energy use
		Transformation sector
		Industry sector
		Transport sector
		Other sector

However, in 2017, the CA decided to allow member economies to report original data in the original unit used in the respective economies. Primary and secondary oil products can be reported in liters, barrels, cubic meters or in any other volume or mass units. For example, gaseous products can be reported in joules, BTU, kilocalorie, etc. Calorific values can be reported in joules, BTU, kilocalorie per unit of volume or mass. The purpose of this flexibility is to minimize data errors resulting from conversion of original volume units to mass units. In order for the CA to convert the original data in a uniform mass units, member economies are also requested to report the densities of each product.

For OECD member economies that also submit annual energy demand and supply data to IEA, the CA accepts data submission using the IEA format. The CA also downloads the revised questionnaires from IEA's Energy Data Centre. The CA developed computer programs to transfer data from the IEA format to APEC format and to generate energy balance tables. This reduces the reporting burden of these economies to IEA, APEC and other international energy organisations.

Collection schedule and actual dates of submission

The CA set the deadline for submission to the end of March 2017. In principle, all 21 APEC members are expected to submit annual data by this deadline. Seven economies were able to submit the five energy questionnaires on time. These are Australia; Canada; China; Hong Kong, China; Japan; the Philippines and Chinese Taipei. However, Hong Kong, China's submissions were preliminary and were finalised only in September 2017. Four non-OECD APEC economies (Indonesia; Malaysia; Singapore and Thailand) submitted after March 2017. Papua New Guinea; Peru and Viet Nam did not submit their respective questionnaires, but Peru and Viet Nam were able to

provide the energy commodity balance and energy balance tables.

Method of data submission

Member economies submit the data files as email attachments. Correspondence for the improvement of data consistency and accuracy had also been carried out mostly through the email communication.

Method of estimation

For economies that lack detailed data as well as those that did not submit the questionnaires, the CA estimated data, filled-out the questionnaires or adopted IEA estimates.

For instance, as Papua New Guinea was not able to submit its annual energy questionnaires, the CA estimated its energy data using various references such as the JODI Oil and JODI Gas data, the annual report of Oil Search Limited, an oil company based in the economy, and information from the economy's privately-operated geothermal power plant. No information on NRE (except for hydro) was available for the economy. From those data and the economic indicators collected from World Bank for the year 2015, the CA estimated the final energy consumption, electricity generation and inputs as well as imports of petroleum products. The CA is hoping that Papua New Guinea would be able to produce its own energy statistics and balances in the future.

As regards Singapore, although the economy submitted the questionnaires, the data lacked the level of details that the energy balance table requires. Hence, the CA as advised by Singapore, used the energy statistics and energy balance produced by IEA as the economy agrees with IEA's methodologies and estimates.

Finally for Peru and Viet Nam, the CA was able to fill-out the questionnaires and consequently produced

the required energy balance tables through the submitted energy commodity balance and energy balance tables.

Standardisation

The APEC reporting format used in the collection of 2015 annual data, gives member economies the flexibility to report data in the original units used in their respective economies. The format also requires the submission of densities of each product to allow conversion of all data to a uniform mass unit. The CA however, does not standardise the conversion factor from physical to energy units in view of the peculiarities in the thermal quantity of each energy product from the different economies. In this regard, the CA makes use of the calorific value data reported by each economy as opposed to using typical conversion factors.

Conversion factors for fossil energy from physical to thermal units

Between the two calorific values, namely gross and net calorific values, APEC adopted the net calorific value agreed from the third experts meeting held in Singapore to facilitate comparisons with international energy statistics such as those of the IEA and United Nations Statistics Division. Therefore, gross calorific values used by some members must be converted to net calorific values. If only gross calorific values are reported, the CA converts them to net calorific values by:

Coal / Oil	multiply the value by 95%
Gas	multiply the value by 90%

Conversion factors for primary electricity

Table 1-2 shows the factors applied to convert primary electricity – i.e. power generated from non-

fossil fuel sources such as hydro, nuclear, geothermal and other power generation – to primary energy units. To allow comparisons of primary energy supplies, in the light of differences in conversion coefficients, standardisation is required. APEC adopted the following efficiency of primary electricity generation for compatibility with IEA and UN statistics.

Table 1.2 • Efficiency of primary electricity generation

Primary Electricity	Efficiency
Hydro Power	100%
Nuclear Power	33%
Geothermal Power*	10%
Other New Power	100%

**Excluding Mexico, New Zealand and the United States. These economies can provide the primary energy equivalent of geothermal electricity outputs.*

The original energy data contained in these statistics have been processed using the adjustments mentioned above.

Secondary data

Using the original data submitted by the member economies, the CA prepares the following tables through the standardisation process.

- (1) Energy balance table
- (2) Primary energy supply table
- (3) Final energy consumption table
- (4) Demand and supply by energy source table
- (5) Electricity table

The energy balance table gives a detailed description of energy sources and their flows.

APEC energy statistics contains the five tables mentioned above. Tables 2 through 5 are collectively referred to as “other tables”, and are compiled from the energy balance table and data obtained from the original data tables after adjustment. Tables 2 through 5 allow comparisons among member economies.

Energy balance table

The structure of energy balance table, in principle, is the same as that of the IEA but with some differences. These are as follows:

- APEC statistics are basically based on official data provided by national government agencies of the member economies, and thus, agencies exclude any data not reported to the government. It is assumed that the IEA estimates these quantities.
- For this reason, some data for private power generations are missing in some member economies. Likewise, some economies have no consumption of biomass in the residential sector.
- The reporting period differs in APEC and IEA surveys.

The APEC energy balance table consists of two tables, quoted in ktoe (10^{10} kilocalories) and in petajoules (PJ equivalent to 10^{15} joules).

Other tables

Other tables such as primary energy supply, final energy consumption, demand and supply by energy source, and electricity, are all designed to allow comparisons among member economies.

The primary energy supply table shows information that constitute the primary energy supply, namely, indigenous production, imports, exports, stock

change, and international marine and aviation bunkers in terms of calorific values (ktoe and PJ), for each of the four categories of coal, petroleum, gas, and primary electricity (hydro, nuclear, geothermal power, etc.).

The final consumption table illustrates the consumption of coal (including coal products), petroleum, gas, electricity and other energy sources for each final consumption sector (agriculture, residential, commercial, industry and transport).

The demand and supply table for each energy source emphasises coal, petroleum and gas, and shows how the primary supply quantity is consumed in the transformation and final energy consumption sectors.

The electricity table illustrates the power generation and fossil fuel input for each of the five categories of thermal, hydro, nuclear, geothermal and other sources of power generation.

Notes on member economies

General notes

Most of the member economies' annual data are tallied by calendar year (1 January - 31 December) except for Australia; Australia's energy statistics are accounted by fiscal year (1 July - 30 June).

In view of harmonisation efforts with the IEA, the CA accepts submission from OECD members using the IEA format. Likewise, to reduce the burden of member economies' statisticians, the CA decided to leave the verification of APEC OECD member economies data to IEA and just used the processed and updated data from IEA.

Specific notes

• *Japan*

Energy data from 2000 are not official data prepared

by the Japanese Government. The CA used data in the energy balance table produced by the Institute of Energy Economics, Japan to maintain consistency of data from before 2000.

• **Papua New Guinea**

The CA estimated the energy balance tables of Papua New Guinea from 2004 to 2015. Data were taken from the crude oil and natural gas production, refinery intake and output data as well as crude oil exports that PNG submits monthly to Joint Organisations Data Initiative. Data on geothermal electricity production were obtained via online research. There is no reliable information on biomass use especially in the household sector, so CA did not estimate consumption of this energy source. Despite the absence of estimates, it is believed that the consumption of this fuel is substantial in the economy considering the relatively low electrification rate and the large portion of the population living in the rural areas.

• **Singapore**

Singapore submitted aggregated data on production and consumption of petroleum products. From the 2014 data, upon the advice of the focal point in the economy, the CA obtained the data (with permission of IEA) from IEA's energy statistics.

Socio-economic data

The socio-economic data of each member economy

shown in the APEC Energy Statistics are not reported by the member economies, but are prepared by the CA. The data are obtained from the *World Development Indicators* of the World Bank and *The International Financial Statistics Yearbook* of the International Monetary Fund (IMF). The data of Chinese Taipei that are not available in these statistics, are derived from the *Chinese Taipei Statistical Data Book*. This book is regularly provided to the CA through the goodwill of this member economy. The items which the CA takes from this publication are:

- Population
- GDP and its components
- Index of Industrial Production
- External Trade (in US dollars)
- Balance of Payment (in US dollar)
- Exchange Rate
- Prices (CPI, etc.)

In addition to reporting GDP in the member economy's currency, the CA provides estimates in real and nominal dollars as well as real Purchasing Power Parity (PPP) values.

APEC energy database

The CA has established the online APEC energy database, which contains all the data in the APEC energy statistics. The database can be accessed at: <http://www.egeda.ewg.apec.org/>.

2 Overview of APEC Energy Situation

Background

This Overview gives a detailed look on the energy situation in APEC in 2015. It also provide an analysis of the total APEC economy compared to the world. For a better understanding of the terms used in the Overview, definitions of terms are also provided in the Appendices. Specific analyses mostly referred here are by region. For ease of comparison this Overview followed the regional groupings of APEC Energy Demand and Supply Outlook as follows:

- Other Americas

Canada; Chile; Mexico; and Peru

- South-East Asia

Brunei Darussalam; Indonesia; Malaysia; the Philippines; Singapore; Thailand; and Viet Nam

- Oceania

Australia; New Zealand; and Papua New Guinea

- Other north-east Asia

Hong Kong, China; Japan; Korea; and Chinese Taipei

- China;

- Russia; and

- The United States

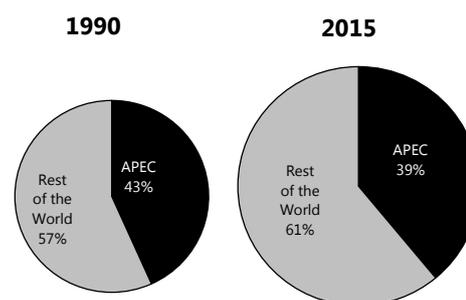

APEC and the world

The following briefly describes APEC in terms of population, GDP and total primary energy supply as compared to the world in 2015 and over the period 1990 to 2015.

Overall population growth in APEC has been slowing down. From the 0.9% compound annual growth rate (CAGR) between the periods 1990 to 2010, CAGR went further down to 0.7% from 2010 to 2015.

Population in APEC stood at 2.85 billion in 2015 from 2.29 billion in 1990. Population of the rest of the world, while also slowing down for the last three years, posted a CAGR of 1.6% from 1990 to reach 4.5 billion in 2015.

Figure 2.1 • World population, 1990 and 2015

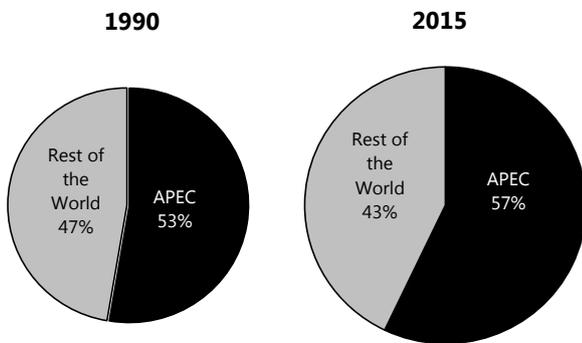

Source: World Bank

The sluggish growth in APEC population is not reflected in some subregions in APEC. As most economies grew only by less than one per cent including the three largest regions, China (0.5%); US (0.7%) and Russia (0.2%). The almost 20 million increase in population from 2014 to 2015, was contributed mainly by the more than one per cent increase in population in Oceania (1.6%), South-East Asia and other Americas (both with 1.2%). The slow growth in APEC population, resulted in a decrease of its share to the world's population from 43% in 1990 to 39% in 2015 (Figure 2.1).

In contrast to its decreasing share in world population, APEC outpaced the world in economic growth. Its GDP (constant USD) surged faster at 5.5% CAGR compared to the rest of the world at 4.0% CAGR over the period 1990 to 2015. China (14.3%); South-East Asia (8.1%) and Oceania (6%) were among the leading growth regions during this period. APEC remained the world's growth leader with a 3.1% increase in GDP (constant USD) from 2014 to 2015. The rest of the world grew by only 2.4% during the same period. Growth picked up across two of the

largest regions in APEC, namely China (6.9%) and US (2.9%). Most economies also recorded positive growth rates except for Russia (-2.8%) and Brunei Darussalam (-0.6%). The sharp drop in oil prices since mid-2014 has affected the growth of these economies which are net oil exporters. Nevertheless, APEC GDP (constant USD) dominated the world GDP (constant USD) in 2015 with a 57% share. This was a four percentage point rise from the 1990 level of 53% (Figure 2.2).

Figure 2.2 • World GDP (constant USD), 1990 and 2015

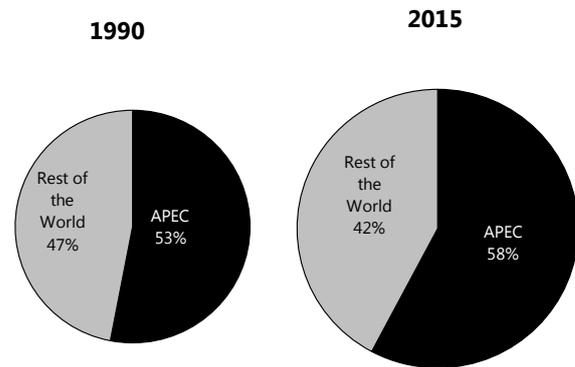

Source: World Bank

Relatedly, in terms of primary energy supply, APEC accounted for 58% of the world's total primary energy supply (TPES) in 2015 (Figure 2.3), an increase from 53% in 1990. Although its share dipped by 0.4 percentage point from the total in 2015 relative to 2014, the CAGR of TPES was 2.1% between 1990 and 2015.

In 2015, APEC TPES stood at 7 885 Mtoe, a 0.4% drop from the 2014 level. This can be attributed to the decline in the energy consumption in major economies and subregions in APEC such as the United States (1.3%), Russia (2.0%), other Americas (1.4%) and other north-east Asia (0.1%). On the other hand, there were increases in TPES in China (0.4%), Southeast Asia (2.0%) and Oceania (0.9%).

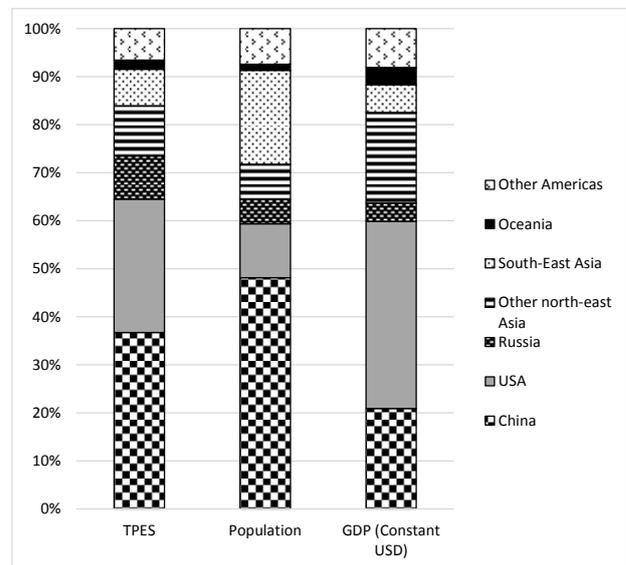

Figure 2.3 • World total primary energy supply, 1990 and 2015

Source: APEC and IEA

Generally, the relative shares of GDP, population and TPES of the subregions in APEC varied from one another (Figure 2.4). Nevertheless, the top regions in terms of TPES in APEC in 2015 were, China (21%); the US (16%) and other north-east Asia (6%), the combined amount of which was more than the amount of TPES of the rest of the world (42%).

Figure 2.4 • TPES, Population and GDP in APEC, 2015

Sources: APEC, IEA and World Bank

Overview of APEC energy situation

Key energy trends in APEC from 1990 to 2015 are described in the following sections.

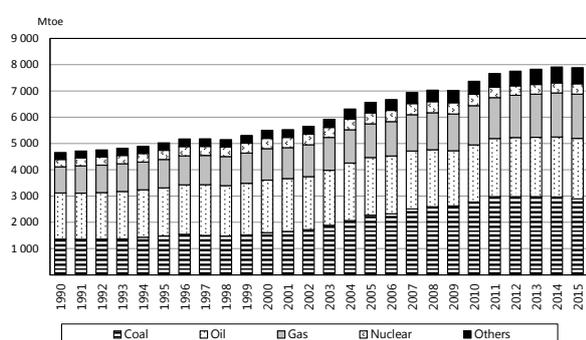

Energy supply trends in APEC

Total primary energy supply

Total primary energy supply (TPES) in APEC in 2015 stood at 7 885 Mtoe, a decline by 0.3% compared with 2014 levels (7 912 Mtoe). Although slowing down for the last five years, this is the first time since 2010 that TPES in APEC posted a negative growth rate. (Figure 2.5).

Coal significantly contributed to the negative growth in TPES in APEC as it declined by 73 Mtoe or 2.5% falling to 2 896 Mtoe in 2015 from 2 969 Mtoe in 2014. The decline in total coal supply can be attributed to the substantial decrease in the US (-13.3%) as well as China (-1.9%) and other north-east Asia (-1.7%). Given this decrease, its compounded annual growth rate (CAGR) between 1990 and 2015 dipped by 0.2 percentage point as compared with previous year's CAGR. Despite this drop, coal still has the largest share in the APEC primary energy mix at 38%.

Figure 2.5 • Total primary energy supply, 1990-2015

Source: APEC data

Oil remained to be the second largest fuel in APEC in 2015 with its share of APEC TPES unchanged since 2010 at 29%. It grew modestly by 0.8% to reach 2 298

Mtoe in 2015. This is slower than the 1.1% CAGR between 1990 and 2015. Most of the regions in APEC experienced negative growths in total oil supply from 2014 to 2015, except for China (5.7%) and the US (1.5%), two largest oil consuming regions in APEC, offsetting the downturn in total oil supply in 2015.

Data improvement between 2014 and 2015 shown gas supply increasing to 2.0% in 2014 instead of 0.5% as previously reported. In 2015, gas supply posted a 0.6% rise from the 2014 levels to reach 1 684 Mtoe. The CAGR of gas supply over the period 1990-2015 was 2.1%.

Nuclear supply continued its recovery with a robust 3.8% increase from 2014 reaching 395 Mtoe in 2015. This was largely contributed by the huge increase in China (28.9%) from 35 Mtoe in 2014 to 45 Mtoe in 2015. Its share to APEC TPES remained minimal at 5% while CAGR was 1.3% between 1990 and 2015.

Geothermal, solar and wind energy, collectively grew by 9.9% or 7.9 Mtoe from 2014 to 2015. Although the total share of these renewable energy sources remained modest at 1.1% of APEC TPES, the CAGR over the period 1990 to 2015 was the highest among the fuels at 4.6%.

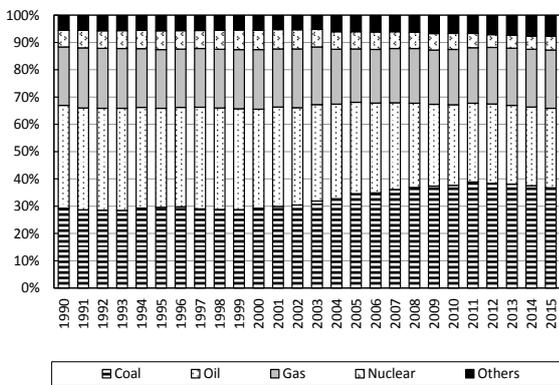

Primary energy mix by region

APEC relies mostly on fossil fuels with 87.2% share of TPES in 2015 (Figure 2.6). Coal which took over the place of oil as the major fuel in 2005 continued to dominate in China with 68% share of the economy's TPES. Oil and gas, the second and third largest fuels in APEC respectively, were dominant in the US. More than one-third of their respective totals in APEC in 2015 were consumed in the US.

Mixes of primary energy per region varied significantly. Different pattern of energy mixes, especially on the major fuels, were observed in three

biggest regions in APEC. China, aside from accounting for the largest share of total coal supply in APEC, its overall primary mix consisted of coal (68%), oil (18%) and other fuels (6%). The top three fuels in the US in 2015 were oil (36%), gas (30%) and coal (17%). US has the largest share of nuclear with more than 50% of APEC total nuclear supply. In Russia, gas (51%) comprised the largest of its energy mix, followed by oil (22%) then coal (16%).

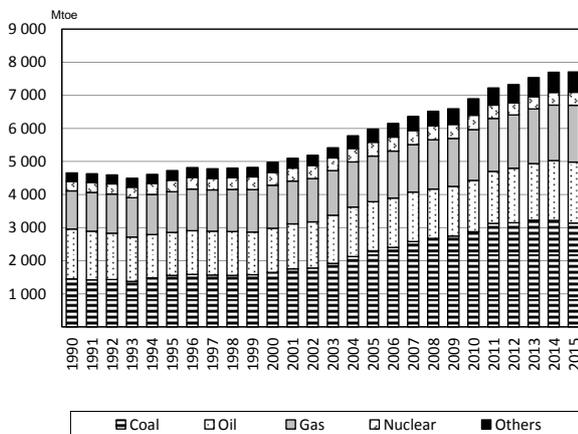

Figure 2.6 • Primary energy mix, 1990-2015

Source: APEC data

In the remaining regions: other Americas, other north-east Asia, South-East Asia and Oceania, oil was the common major fuel— comprising more than one-third of their respective primary energy mixes in 2015 (Figure 2.7).

Figure 2.7 • Primary energy mix by region, 2015

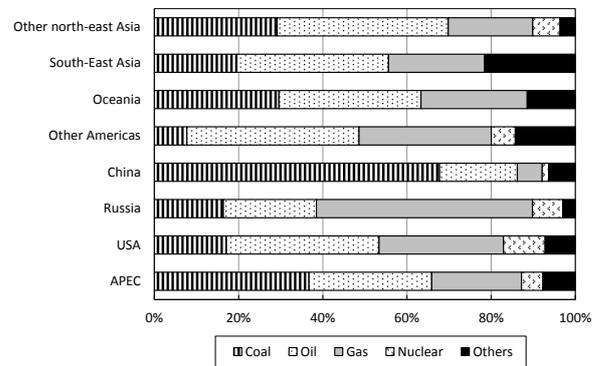

Source: APEC data

While most of these regions consisted of either coal or gas as the second or third major fuel, other fuels is the third largest in South-East Asia’s energy mix in 2015. Other fuels include traditional biomass which is used widely in the rural areas.

Indigenous production

Indigenous energy production increased very minimally by 0.1% in 2015 (7 704 Mtoe) from the 2014 levels. This was a 2.1 percentage point drop from the previous year’s growth (2.2%) significantly caused by the 2.5% decrease in coal production. Nuclear production continued to improve with 3.8% increase from the 2014 levels. Although there was a big gap in the production rate from the previous year, the CAGR between 1990 and 2015 was maintained at 2.0% (Figure 2.8).

Figure 2.8 • APEC Indigenous production, 1990-2015

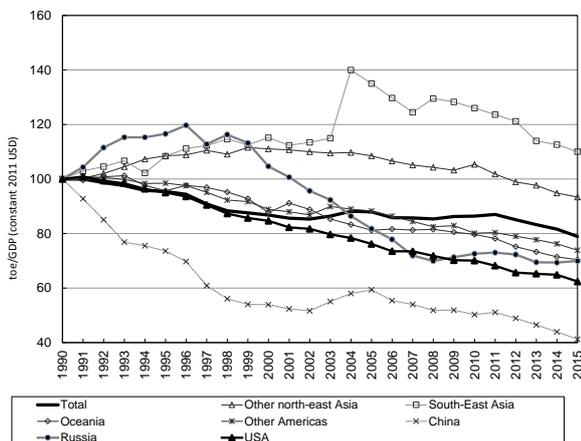

Source: APEC data

Primary energy intensity

Given that APEC TPES slowed down in 2015, its primary energy intensity (*Total primary energy supply/GDP* (in 2011 USD PPP) has improved. The primary energy intensity was estimated at 185 toe/million (2011 USD PPP) in 2015, a 3.3% reduction over the previous year’s primary energy intensity level and 21% improvement over the 1990 level (235.1 toe/million (2011 USD PPP). On regional level, China’s primary energy intensity continued to

improve with 6.1% reduction from the 2014 level, followed by the US (-3.8%) and other Americas (-3.1%) (Figure 2.9).

Figure 2.9 • Primary energy intensity by region, 1990-2015

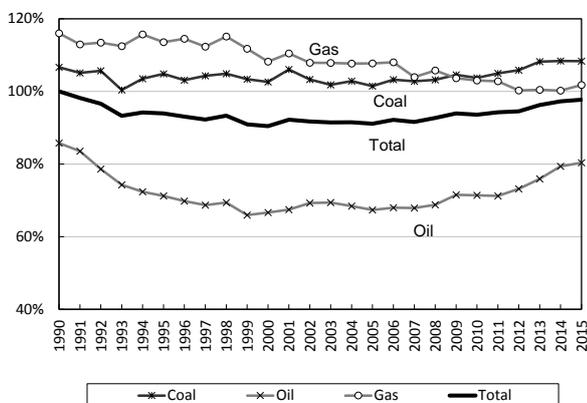

Source: APEC and World Bank

Self-sufficiency

APEC continued to prove self-sufficient over the years. In 2015, although minimal, the overall self-sufficiency level (*Indigenous production/ Total primary energy supply*) increased by 0.4 percentage point from the 2014 levels of 97.1%. The self-sufficiency ratio of oil continued to be the lowest (80.3%) among all the fuels in APEC in 2015.

Figure 2.10 • APEC energy self-sufficiency, 1990-2015

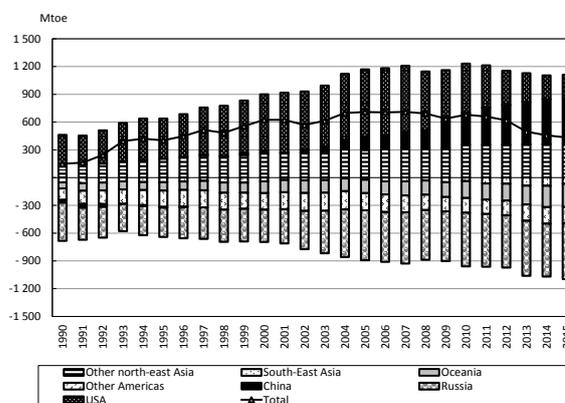

Source: APEC data

Net imports by region

APEC region as a whole is a net importer. Imports declined by 4% in 2015. Its net imports (*Imports – Exports*) reached 432 Mtoe in 2015, 5% lower than net import levels observed in 2014. Between the periods 1990 to 2015, the CAGR of net imports was 4.3% (Figure 2.10). On regional level, China, other north-east Asia, and the US were net importers in 2015 while the remaining regions in APEC were net exporters, the biggest of which was Russia.

Figure 2.11 • Net imports by region, 1990-2015

Source: APEC data

Power generation

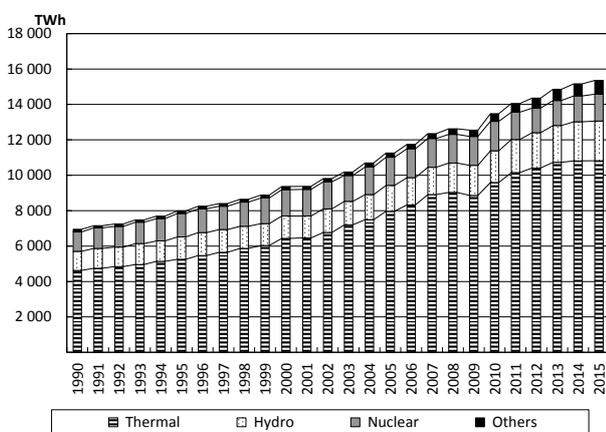

Electricity demand in APEC is continuously increasing, although in 2015, power generation increased a bit slower than the previous year. Total power generation reached 15 353 TWh in 2015, a 1.2% expansion but 0.9 percentage point lower than the 2014 growth. Given this slower growth, power generation between 1990 and 2015 posted a 0.1 percentage point lower CAGR (3.2%).

Albeit the minimal growth (+0.1% to reach 10 817 TWh in 2015), electricity sourced from fossil fuels continued to dominate the total power generation in APEC, maintaining 70% of total generation output in 2015. Its CAGR over the period 1990-2015 is still significant at 3.5%. Electricity output from

hydropower and nuclear came second (15% share) and third (10% share) of APEC's power generation in 2015, increasing by 1.5% and 3.8%, respectively.

Although the shares from the total power generation were marginal, other power sources [other renewables (4.7%)] and geothermal (0.4%) offset the slight increase in thermal power generation in 2015 with a robust 14.4% (721 TWh) and 3.0% (57 TWh) increases, respectively from the 2014 levels.

Figure 2.12 • Power generation by type, 1990-2015

Source: APEC data

Power generation mix by region

Power generation by region varied in 2015. The huge share of fossil fuel in total generation in APEC of 70.5% was contributed mainly by coal (46.1%), gas (22.6%) and oil (1.9%). Generation output from hydropower increased slower than 2014 at 1.5% to reach 2 223 TWh in 2015. This still kept hydro to remain as second biggest source of power generation in APEC at 14.5%. Nuclear energy contributed 10% while other sources such as geothermal, solar, wind and others contributed the balance of 5%.

South-East Asia's primary energy mix had the highest contribution from fossil fuels among subregions in APEC. Fossil fuels comprised 84.8% of the total power generation. However, the largest contribution among

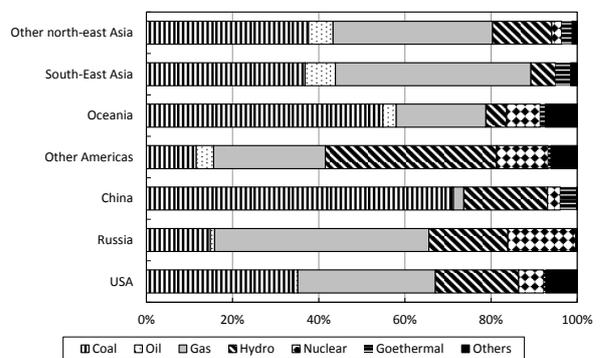

the fossil fuels is natural gas with 42.5%. Coal and oil had 36.5% and 5.8% shares, respectively. In this subregion, the share of new and renewable energy (NRE) is 15.2%.

Other north-east Asia had the second largest share from fossil fuels. In this subregion, however, the largest fossil fuel source was coal with 37.7% followed by natural gas with 37.0%. Nuclear energy in this subregion comprised 10.8% of the total power generation. NRE's share was 8.7%.

The next subregion with highest fossil fuel source was Oceania with 76.3%. Among this fossil fuels, coal had the largest share of 53.4%. Natural gas followed with 19.9%. The share of NRE was 23.7%.

China's power generation mix had 73.7% fossil fuel share with coal taking the largest chunk of 70.9%. Natural gas had a small share of 2.4%. Hydro was big in China with a 19.4% share. Nuclear energy followed with 3.9%.

Figure 2.13 • Power generation mix by region, 2015

Source: APEC data

The USA's power generation mix had a 67.2% fossil fuel component, 34.3% of which coming from coal and 32.0% from gas with oil taking the balance. Nuclear energy had the largest contribution (in APEC) of 19.3%. NRE including hydro contributed 13.5%.

Russia had the second smallest power generation from fossil fuels among APEC subregions at 65.5%,

49.7% of which coming from natural gas and coal with only 14.9%. Nuclear energy in Russia has the second largest share in APEC of 18.3% while NRE had 16.1%.

Other Americas' power generation mix had the lowest fossil fuel contribution of 41.7%, broken down as gas (26.0%), coal (11.6%) and oil (0.4%). This subregion has the largest contribution from hydro of 39.9%. Nuclear has 12.0% while other NRE had 6.3%.

Energy demand trends in APEC

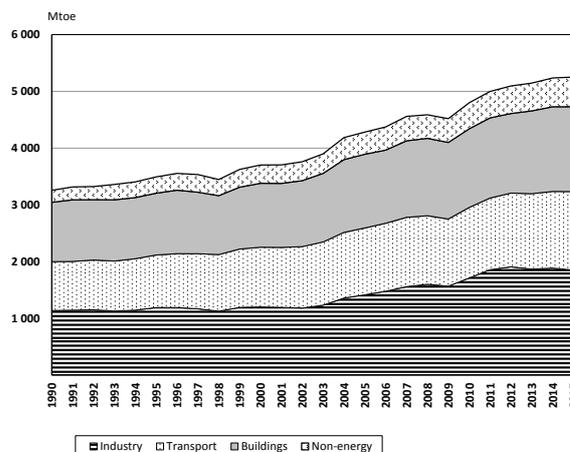

Total final energy consumption by sector

Similar trend happened in total final energy consumption (TFEC), just like in total primary energy supply in 2015. A slower growth of 0.01% was recorded in 2015 to reach 4 728 Mtoe. This is the first time in which TFEC grew less than 1% since it started to slow down in 2010. Even so, the CAGR of TFEC between 1990 and 2015 remained at 1.8%. The weakening of TFEC should not be regarded negatively, as slower energy growth is also indicative of the trend towards energy efficiency. If non-energy use is added, total energy consumption in 2015 reached 5 250 Mtoe or 0.3% more than 2014.

In 2015, energy use by sector did not change from 2014. Including non-energy, industry continued to be the leading consuming sector (35%) followed by buildings (residential, commercial and agriculture sub-sectors combined) sector (29%) then transport sector (26%) and finally non-energy use (10%) (Figure 2.13).

Interestingly, while the industry was the major energy consuming sector in APEC, it declined by 1.8% from its 2014 consumption levels to reach 1 849 Mtoe in 2015. If non-energy use is included, total industry consumption reached 2 372 Mtoe which is half of the TFEC in 2015.

Figure 2.14 • Total final energy consumption in APEC by sector, 1990-2015

Source: APEC data

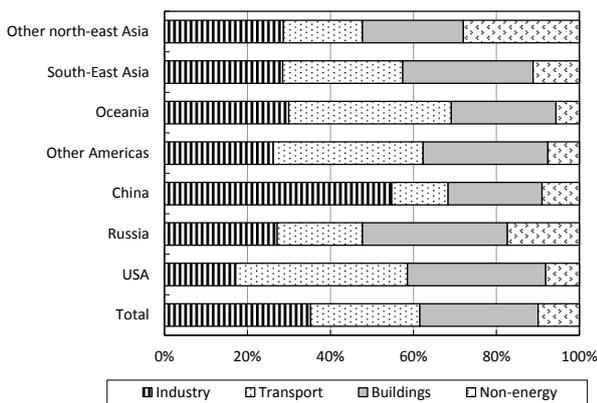

Although the buildings sector was the second largest consuming sector in APEC, its consumption grew minimally in 2015 (0.2%) reaching 1 496 Mtoe. Over the period 1990 to 2015, its CAGR reached 1.4%. The transport sector meanwhile grew faster than industry and buildings sectors at 2.3% in 2015 or 1 383 Mtoe. The increase from 2014 to 2015 was even faster than its CAGR between 1990 and 2015 at only 1.9%.

As in previous years, non-energy use in industry swelled faster than other major energy sectors in APEC. It posted an upward trend of 2.8% in 2015. Its CAGR between 1990 and 2015, although 0.6 percentage point lower than the previous year, was even significant at 3.7%.

Different trends can be said on energy consumption by region (Figure 2.14). The change in final energy consumption in 2015 against 2014 was again driven by developing economies. Contributing factor to the increase in APEC TFEC was the faster energy consumption growth in South-East Asia at 2.4% over the 2014 levels, owing to its fast growing economy. More than 35% of the energy consumption in APEC in 2015 was attributed to China, hence the economy had a significant influence in APEC TFEC trends. As has been in previous years, energy consumption in

the industry sector (55% of APEC TFEC) was largest in China in 2015. Due to its sheer size, its industry sector's declining energy consumption sector (-2.9%) brought the downtrend in APEC TFEC in 2015. This could be partly attributed to the government's policy to move towards consumer and service oriented economy.

Figure 2.15 • Total final energy consumption in APEC by region by sector, 2015

Source: APEC data

As it turned-out, China's structural change brought the economy's consumption levels in the buildings sector to surge by 6.4% to reach 420 Mtoe in 2015. Oceania likewise contributed a 3.2% increase in the buildings energy consumption which offset the decrease in the US (-3.8%) and other Americas (-1.0%) in 2015. The combined consumption levels of buildings sector in the United States and China in 2015 continued to make up more than 60% of the total APEC buildings consumption in 2015.

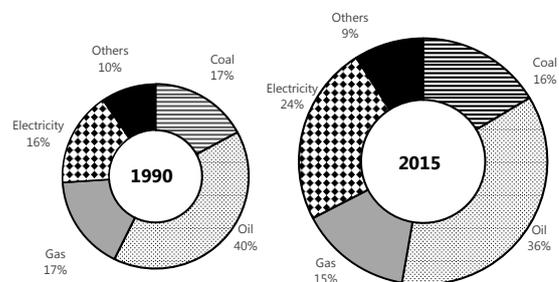

Rapidly increasing income per capita and urbanisation in APEC, especially in developing economies, contributed to the growth of its transport demand. Positive increases were posted in most regions in APEC, top three of which were China (5.5%), other north-east Asia (3.9%) and South-East Asia (3.5%). Together, the combined energy consumption in the transport sectors of these three regions reached 419 Mtoe in 2015, more than 30% of APEC

transport consumption. The US (45% share in 2015), the major consumer in APEC transport sector, also posted a positive growth (1.9%) bringing the robust demand growth in the transport sector.

Final energy consumption by energy source

Oil continued to dominate the final energy consumption in APEC in 2015. It accounted for 36% of the TFEC in 2015 followed by electricity with 24% share and coal with 16% (Figure 2.15).

Figure 2.16 • Total final energy consumption by energy source, 1990 and 2015

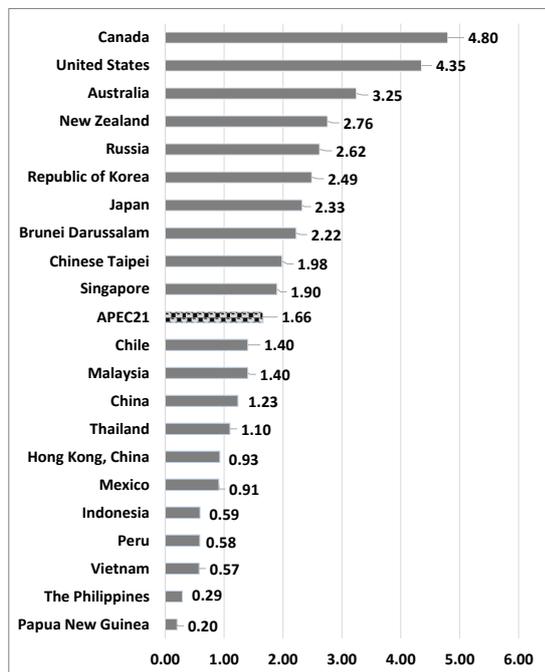

Source: APEC data

Oil also posted a positive growth at 3% over 2014 to reach 1 719 Mtoe in 2015 and electricity grew by 1%, Coal continued its dip since 2013 and posted a 4% decrease in 2015. Gas and other fuels (renewables), which showed positive increases in the previous year posted declines of 2.8% and 1.7%, respectively in 2015. These decreases mainly contributed to the sluggish growth in APEC TFEC in 2015.

Final energy consumption per capita

The region's diverse grouping of economies includes some of the world's most energy-intensive (Brunei Darussalam, Canada and the United States) and also the least energy-intensive (Papua New Guinea, Peru and the Philippines).

Figure 2.17 • Energy consumption per capita, 2015

Sources: APEC data (FEC) and World Bank (Population)

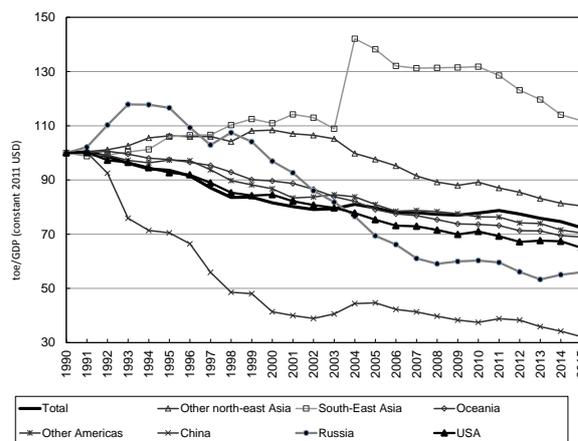

Final energy per capita in APEC in 2015 was almost unchanged since 2014, on average, energy per capita remained at 1.7 tonnes of oil equivalent (toe). The top three economies in terms of final energy per capita still comprised of Canada (4.8 toe), the US (4.4 toe) and Australia (3.3 toe) (Figure 2.16). Despite significant influence in demand trends in APEC, China and South-East Asia’s energy per capita remained well below the APEC average. Final energy demand per capita in 2015 of both regions was 1.2 toe on average. Seven economies have final energy per capita below one toe in 2015 which ranged from 0.9 toe to 0.2 toe.

Final energy intensity

Final energy intensity [*Total final energy supply/GDP* (2011 USD PPP)] in APEC continued to show improvement for the last two decades. Between the period 1990 to 2015, energy intensity was estimated to reduce by 27.6% or 1.3% on average. In 2015, final

energy intensity reached 110.9 toe/million USD (2011 PPP) in 2015 representing a 3.0% improvement from the 2014 final energy intensity level of 114 toe/million USD (2011 PPP) (Figure 2.17). China posted the biggest reduction with 6.0% then the US (-3.6%) and South-East Asia (-1.9%).

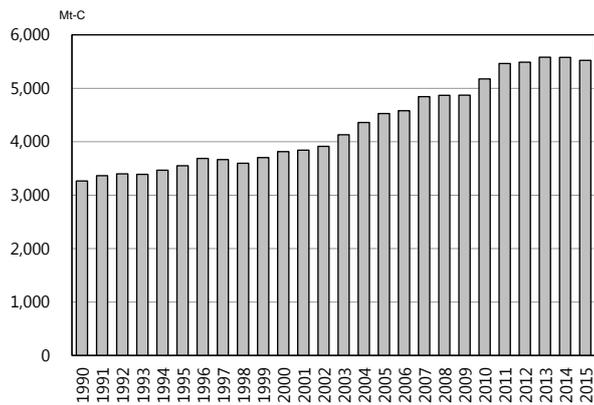

Figure 2.18 • Final energy intensity by region, 1990-2015

Sources: APEC data (FEC) and World Bank (GDP)

CO₂ emissions

The data for CO₂ emissions in 2015 were collected from five member economies, namely: Canada; Hong Kong, China; Japan; Chinese Taipei and Thailand. The CA calculated the CO₂ emissions of 16 other member economies using the 2015 energy balance tables. From the submitted and calculated data, CO₂ emissions from fuel combustion in APEC was 5 522 Mt-C in 2015. This represented a slight decrease of 1% from 5 578 Mt-C in 2014. The compounded annual growth rate from 1990 to 2015, however, was 2.1%.

Figure 2.19 • CO₂ Emission in the APEC region, 1990-2015

Energy Balance Table

This section presents the 2015 aggregate energy balance table of APEC. Note that the export/import

row does not show the volume of trade between the APEC region and the rest of the world.

Some of the salient points shown in the table are as follows:

57.0% of coal was used for power generation.

The category "Other" consisted mainly of waste and commercial renewable energy, such resources being used to generate electricity and directly consumed in the industrial sector and the residential/commercial sector.

Heat accounted for 4.2% of final energy consumption.

Oil and petroleum products accounted for 36.4% of final energy consumption, followed (in order) by electricity (23.6%), coal (16.4%), and gas (14.6%).

A. Definition of products

Coal

This section includes coal, i.e. solid fossil fuel consisting of carbonised vegetal matter, and coal products derived directly or indirectly from the various classes of coal by carbonisation or pyrolysis processes, by the aggregation of finely divided coal or by chemical reactions with oxidising agents, including water.

1. Anthracite

A high-rank, hard coal with a gross calorific value (moist, ash- free basis) greater than or equal to 24 MJ/kg and a Vitrinite mean random reflectance greater than or equal to 2.0 per cent.

2. Coking coal

A bituminous coal that can be used in the production of a coke capable of supporting a blast furnace charge.

3. Bituminous coal

A medium-rank hard coal with either a gross calorific value (moist, ash-free basis) not less than 24 MJ/kg and with a Vitrinite mean random reflectance less than 2.0 per cent, or a gross calorific value (moist, ash-free basis) less than 24 MJ/kg provided that the Vitrinite mean random reflectance is equal to or greater than 0.6 per cent.

4. Sub-bituminous coal

A brown coal with a gross calorific value (moist, ash-free basis) equal to or greater than 20 MJ/kg but less than 24 MJ/kg.

5. Lignite

A brown coal with a gross calorific value (moist, ash-free basis) less than 20 MJ/kg.

6. Peat

A solid formed from the partial decomposition of dead vegetation under conditions of high humidity and limited air access (initial stage of coalification). It is available in two forms for use as a fuel, sod peat and milled peat.

7. Patent fuel

A composition fuel made by moulding hard coal fines into briquette shapes with the addition of a binding agent.

8. Coke oven coke

Coke comprises coke oven coke and gas coke.

- **Coke oven coke:** the solid product obtained from carbonisation of coking coal at high temperature. Coke oven coke is low in moisture, and volatile matter and has the mechanical strength to support a blast furnace charge. It is used mainly in the iron and steel industry acting as heat source and chemical agent.
- **Gas coke:** a by-product from the carbonisation of bituminous coal for the manufacture of "gas works gas". Gas coke is used mainly for heating purposes.

9. Coal tar

The liquid by-product of the carbonisation of coal in coke ovens.

10. BKB/PB (Braunkohlenbriketts/Peat briquettes)

BKB is a composition fuel made of brown coal produced by briquetting under high pressure with or without the addition of a binding agent.

Peat briquette is a fuel comprising of small blocks of dried, highly compressed peat made without a binding agent.

11. Gas works gas

This group includes gases obtained from the carbonisation or gasification of carbonaceous material of fossil or biomass origins in gas works. The gases comprise: (a) gases obtained from carbonisation or gasification of coals, cokes, biomass or waste; and (b) substitute natural gas (a methane-rich gas) made from synthesis gas.

12. Coke oven gas

A gas produced from coke ovens during the manufacture of coke oven coke.

13. Blast furnace gas

The by-product gas of blast furnace operation

consisting mainly of nitrogen, carbon dioxide and carbon monoxide. The gas is recovered as it leaves the furnace. Its calorific value arises mainly from the carbon monoxide produced by the partial combustion of coke and other carbon bearing products in the blast furnace. It is used to heat blast air and as a fuel in the iron and steel industry. It may also be used by other nearby industrial plants. Note that where carbonised biomass (e.g, charcoal or animal meal) is used in blast furnaces, part of the carbon supply may be considered renewable.

14. Oxygen steel furnace gas

The by-product gas of the production of steel in a basic oxygen furnace. The gas is recovered as it leaves the furnace.

Oil

1. Crude oil

A mineral oil of fossil origin extracted by conventional means from underground reservoirs, and comprises liquid or near-liquid hydrocarbons and associated impurities such as sulphur and metals.

It exists in the liquid phase under normal surface temperature and pressure, and usually flows to the surface under the pressure of the reservoir. This is termed "conventional" extraction. Crude oil includes condensate from condensate fields, and "field" or "lease" condensate extracted with the crude oil.

2. Natural gas liquids (NGL)

Mixture of ethane, propane, butane (normal and iso), (iso) pentane and a few higher alkanes collectively referred to as pentanes plus.

NGL are produced in association with oil or natural

gas. They are removed in field facilities or gas separation plants before sale of the gas. All of the components of NGL except ethane are either liquid at the surface or are liquefied for disposal.

3. Refinery feedstocks

Oils or gases from crude oil refining or the processing of hydrocarbons in the petrochemical industry which are destined for further processing in the refinery excluding blending. Typical feedstocks include naphthas, middle distillates, pyrolysis gasoline and heavy oils from vacuum distillation and petrochemical plants.

4. Additives/Oxygenates

Compounds added to or blended with oil products to modify their properties (octane, cetane, cold properties, etc.) Examples of these products are: (a)

oxygenates such as alcohols (methanol, ethanol) and ethers such as methyl tertiary butyl ether (MTBE), ethyl tertiary butyl ether (ETBE), tertiary amyl methyl ether (TAME); (b) esters such as (e.g., rapeseed or dimethylester, etc.) and (c) chemical compounds such as tetramethyllead (TML), tetraethyllead (TEL) and detergents. Some additives and oxygenates may be derived from biomass while others may be of hydrocarbon origin.

5. Biofuels

Fuels derived directly or indirectly from biomass.

- **Biogasoline:** liquid fuels derived from biomass and used in spark-ignition internal combustion engines.
- **Biodiesel:** liquid biofuels derived from biomass and used in diesel engines.
- **Bio-jet kerosene:** liquid biofuels derived from biomass and blended with or replacing jet kerosene.
- **Bioethanol:** ethanol produced from biomass and/or biodegradable fraction of waste;
- **Biomethanol:** methanol produced from biomass and/or the biodegradable fraction of waste;
- **Biodimethylether:** a diesel quality fuel produced from biomass and/or the biodegradable fraction of waste;
- **Bio-oil:** a pyrolysis oil fuel produced from biomass

6. Other hydrocarbons

These are non-conventional oil and hydrogen. Non-conventional oils refer to oils obtained by non-conventional production techniques, that is oils which are extracted from reservoirs containing extra heavy oils or oil sands which need heating or treatment (e.g., emulsification) in situ before they can

be brought to the surface for refining/processing. They also include oils extracted from oil sands, extra heavy oils, coal and oil shale which are at, or can be brought to the surface without treatment and require processing after mining (ex situ processing). Non-conventional oils may also be produced from natural gas. Hydrogen, although not a hydrocarbon, is included unless it is a component of another gas.

7. Refinery gas (not liquefied)

A mixture of non-condensable gases mainly consisting of hydrogen, methane, ethane and olefins obtained during distillation of crude oil or treatment of oil products (e.g., cracking) in refineries or from nearby petrochemical plants. It is used mainly as a fuel within the refinery.

8. Ethane

A naturally gaseous straight-chain hydrocarbon (C₂H₆). Ethane is obtained at gas separation plants or from the refining of crude oil. It is a valuable feedstock for petrochemical manufacture.

9. Liquefied petroleum gases (LPG)

Refers to liquefied propane (C₃H₈) and butane (C₄H₁₀) or mixtures of both. Commercial grades are usually mixtures of the gases with small amounts of propylene, butylene, isobutene and isobutylene stored under pressure in containers.

10. Naphtha

Refers to light or medium oils distilling between 30°C and 210°C which do not meet the specification for motor gasoline. The main uses for naphthas are as feedstock for high octane gasolines and the manufacture of olefins in the petrochemical industry.

11. Gasolines

Complex mixtures of volatile hydrocarbons distilling between approximately 25°C and 220°C and consisting of compounds in the C₄ to C₁₂ range.

- **Motor gasoline:** motor gasoline is a mixture of some aromatics (for example, benzene and toluene) and aliphatic hydrocarbons in the C₅ to C₁₂ range. The distillations range is 25°C to 220°C. Motor gasoline may also contain biogasoline products.
- **Aviation gasoline:** aviation gasoline is gasoline prepared especially for aviation piston engines with additives which assure performance under flight conditions. Aviation gasolines are predominantly alkylates (obtained by combining C₄ and C₅ isoparaffins with C₃, C₄ and C₅ olefins) with the possible addition of more aromatic components including toluene. The distillation range is 25°C to 170°C.
- **Gasoline-type jet fuel:** this includes all light hydrocarbon oils for use in aviation turbine power units, distilling between 100°C and 250°C. They are obtained by blending kerosene and gasoline or naphtha in such a way that the aromatic content does not exceed 25% in volume and the vapor pressure is between 13.7 kilopascal (kPa) and 20.6 kPa.

12. Kerosenes

Comprise kerosene-type jet fuel and other kerosene. This is a mixture of hydrocarbons in the range C₉ to C₁₆ distilling over the temperature interval 145°C to 300°C, but not usually above 250°C, and with a flash point above 38°C.

- **Kerosene type jet fuel:** this is a blend of kerosene suited to flight conditions with particular specifications, such as freezing point. The specifications are set down by a small number of national standards committees, most notably, ASTM (US), MOD (UK), GOST (Russia).
- **Other kerosene:** kerosene used for heating, cooking, lighting, solvents and internal combustion engines. Other names of this

product are burning oil, vaporising oil, power kerosene and illuminating oil.

13. Gas/Diesel oil (Distillate fuel oil)

Middle distillates, predominantly of carbon number range C₁₁ to C₂₅ and with a distillation range of 160°C to 420°C. This product comprises road diesel and heating or other gas oil.

14. Fuel oil

This comprises residual fuel oil and heavy fuel oil which is usually a blended product based on the residues from various refinery, distillation and cracking processes. Residual fuel oils A-5 have a distillation range of 350°C to 650°C and a kinematic viscosity in the range 6 to 55 centistokes (cSt) at 100°C. Their flash point is always above 60°C and their specific gravity is above 0.95.

15. White spirit and SBP

White spirit and special boiling point industrial spirits (SBP) are refined distillate intermediates with a distillation in the naphtha/kerosene range. They are mainly used for non-fuel purposes and sub-divided as: (a) white spirit - an industrial spirit with a flash point above 30°C and a distillation range of 135°C to 200°C; and (b) industrial spirit (SBP) – light oils distilling between 30°C and 200°C.

16. Lubricants

Oils, produced from crude oil, for which the principal use is to reduce friction between sliding surfaces and during metal cutting operations.

17. Bitumen

A solid, semi-solid or viscous hydrocarbon with a colloidal structure, being brown to black in color. It is obtained as a residue in the distillation of crude oil and by vacuum distillation of oil residues from atmospheric distillation. It should not be confused with the nonconventional primary extra heavy oils

which may also be referred to as bitumen.

18. Paraffin waxes

Residues extracted when dewaxing lubricant oils. The waxes have a crystalline structure which varies in fineness according to the grade, and are colourless, odourless and translucent, with a melting point above 45°C.

19. Petroleum coke

A black solid obtained mainly by cracking and carbonising heavy hydrocarbon oils, tars and pitches. It consists mainly of carbon (90 to 95 per cent) and has a low ash content. The two most important categories are "green coke" and "calcined coke". Green coke (raw coke) is the primary solid

carbonisation product from high boiling hydrocarbon fractions obtained at temperatures below 630°C. It contains 4-15 per cent by weight of matter that can be released as volatiles during subsequent heat treatment at temperatures up to approximately 1330°C. Calcined coke is a petroleum coke or coal-derived pitch coke obtained by heat treatment of green coke to about 1330°C. It will normally have a hydrogen content of less than 0.1 per cent by weight.

20. Other products

Other products include products (including partly refined products) from the refining of crude oil and feedstocks which are not specified above.

Gas

1. Natural gas

A mixture of gaseous hydrocarbons, primarily methane, but generally also including ethane, propane and higher hydrocarbons in much smaller amounts and some noncombustible gases such as nitrogen and carbon dioxide.

- **Associated gas:** gas produced in association with crude oil.
- **Non-associated gas:** gas originating from fields producing hydrocarbons only in gaseous form.
- **Colliery gas:** gas recovered from coal mines.
- **Shale gas:** natural gas produced from

hydrocarbon rich shale formation. Shale gas is typically a dry gas primarily composed of methane (90% or more methane), but some formations do produce wet gas.

- **Coal seam gas:** Coal seam gas (also known as coal bed methane) is a form of natural gas extracted from coal seams.

2. LNG

Liquid natural gas is produced by liquefaction of natural gas, liquefied by reducing its temperature in order to simplify storage and transportation when production sites are remote from centres of consumption and pipeline transportation is not economically practicable.

New and renewable energy

1. Fuelwood

Fuelwood (in log, brushwood, pellet or chip form) obtained from natural or managed forests or isolated trees. Also included are wood residues used as fuel and in which the original composition of wood is retained. Charcoal and black liquor are excluded.

2. Woodwaste

Yard trash and types of waste typically generated by sawmills, plywood mills, and woodyards associated with the lumber and paper industry, such as wood residue, cutoffs, wood chips, sawdust, wood shavings, bark, wood refuse, wood-fired boiler ash, and plywood or other bonded materials that contain only phenolic-based glues or other glues that are approved specifically by the administrative authority.

3. Bagasse

The fuel obtained from the fibre which remains after juice extraction in sugar cane processing.

4. Charcoal

The solid residue from the carbonisation of wood or other vegetal matter through slow pyrolysis.

5. Other biomass

All other solid biomass products not specifically mentioned above. This includes agricultural wastes such as straw, rice husks, nut shells, poultry litter, crushed grape dregs, palm oil bunches, etc. The quantity of fuel used should be reported on a net calorific value basis.

6. Biogas

Gases arising from the anaerobic fermentation of biomass and the gasification of solid biomass (including biomass in wastes).

- **Landfill gas:** biogas from the anaerobic fermentation of organic matter in landfills.

- **Sewage sludge gas:** biogas from the anaerobic fermentation of waste matter in sewage plants.
- **Other biogas:** other biogases from anaerobic fermentation not elsewhere specified.

7. Industrial waste

Non-renewable waste which is combusted with heat recovery in plants other than those used for the incineration of municipal waste.

8. Municipal solid waste (renewables)

Household waste and waste from companies and public services that resembles household waste and which is collected at installations specifically designed for the disposal of mixed wastes with recovery of combustible liquids, gases or heat.

9. Liquid Biofuels

Liquids derived from biomass and used as fuels.

- **Biogasoline** refers to liquid fuels derived from biomass and used in spark- ignition internal combustion engines. Biogasoline may be blended with petroleum gasoline or used directly in engines. The blending may take place in refineries or at or near the point of sale.
- **Bioethanol** refers to ethanol produced from biomass.
- **Biodiesel** refers to liquid biofuels derived from biomass and used in diesel engines. Biodiesels may be blended with petroleum diesel or used directly in diesel engines.
- **Bio-jet kerosene** refers to liquid biofuels derived from biomass and blended with or replacing jet kerosene.

10. Hydro

Electricity produced from devices driven by fresh,

flowing or falling water.

11. Geothermal

Electricity and heat generation produced from geothermal plants.

12. Solar

- **Electricity from solar photovoltaics** refers to electricity produced by the direct conversion of solar radiation through photovoltaic processes in semiconductor devices (solar cells), including concentrating photovoltaic systems.
- **Heat from concentrating solar thermal** refers to high temperature heat produced from solar radiation captured by concentrating solar

thermal systems. The high temperature heat can be transformed to generate electricity, drive chemical reactions, or be used directly in industrial processes.

- **Heat from non-concentrating solar thermal** refers to low temperature heat produced from solar radiation captured by non-concentrating solar thermal systems.

13. Tide/wave/ocean

Electricity generation produced from tide / wave / ocean.

14. Wind energy

Electricity produced from devices driven by wind.

Electricity and heat

1. Thermal

Electricity and heat generation from combustible fuels such as coal, oil and gas.

2. Hydro

Power generation from hydro plants, including pumped up (pumped storage) plants.

3. Nuclear

Electricity and heat generation from nuclear plants.

4. Geothermal

Electricity and heat generation from geothermal plants.

5. Renewable energy

Electricity and heat generation from solar, biomass, and waste and electricity generation from tide, wave, ocean and wind.

▫ Solar

- **Electricity:** quantity of electricity generated by solar photovoltaic and from solar thermal systems.
- **Heat:** solar energy exploited for hot water production by: Flat plate collectors, mainly of the thermosyphon type, for domestic hot water or for the seasonal heating of swimming pools.

Note: Passive solar energy for the direct heating, cooling and lighting dwellings or other buildings is not included.

- **Tide, wave, ocean:** electricity generation produced from tide / wave / ocean.
- **Wind:** electricity produced from devices driven by wind.
- **Biomass:** electricity and heat produced by fuelwood, woodwaste, bagasse, other biomass, biogas and liquid biofuels.

- **Waste:** electricity and heat produced by industrial waste and municipal solid waste.

6. Others

Electricity and heat generation from other fuel sources such as fuel cells, etc.

B. Definition of flows

Supply sector

Domestic supply is defined as *indigenous production + from other sources + imports - exports - international marine bunkers - international aviation bunkers ± stock changes*.

1. Production

Production is defined as the capture, extraction or manufacture of fuels or energy in forms which are ready for general use. In energy statistics, two types of production are distinguished, primary and secondary. *Primary production* is the capture or extraction of fuels or energy from natural energy flows, the biosphere and natural reserves of fossil fuels within the national territory in a form suitable for use. Inert matter removed from the extracted fuels and quantities reinjected, flared or vented are not included. The resulting products are referred to as "primary" products. *Secondary production* is the manufacture of energy products through the process of transformation of primary fuels or energy. The quantities of secondary fuels reported as production include quantities lost through venting and flaring during and after production. In this manner, the mass, energy and carbon within the primary source(s) from which the fuels are manufactured may be balanced against the secondary fuels produced. Fuels, electricity and heat produced are usually sold but may be partly or entirely consumed by the producer.

There are a few specificities according to the fuels:

- **Oil:** production includes only marketable production, and excludes volumes returned to formation. Such production should include all crude oil, NGL, condensates and oil from shale and tar sand, etc. It should also include the

receipts of additives/ oxygenates by refineries and blending plants from outside the refinery sector.

- **Natural gas:** all dry marketable production is measured after purification and extraction of NGLs and sulphur. Quantities reinjected, vented or flared, are not included. Production includes quantities used within the natural gas industry; in gas extraction, pipeline systems and processing plants.

Calculation of production of hydro, geothermal, solar, wind, etc. and nuclear follows some conventions used by selected international organisations.

As regards the production of secondary energy in the basic energy statistics, production of secondary oil products represents the gross refinery output. Secondary coal products and gases represent the output from coke ovens, gas works, blast furnaces and other transformation processes. In the energy balances production of secondary products is zero and the gross refinery output is included in the transformation sector.

Production from other sources: production from other sources refers to both primary energy that has not been accounted for under production and secondary energy that has been accounted for in the production of another fuel. There are a few examples:

- additives and other hydrocarbons produced from coal, gas or renewables;
- oil and coal used in natural gas blending plants to adjust calorific value;
- recovered slurries, middling and other low

grade coal products which cannot be classified according to the main categories of coal.

2. Imports and exports

Imports of energy products comprise all fuel and other energy products entering the national territory. Goods simply being transported through a country (goods in transit) and goods temporarily admitted are excluded but re-imports, which are domestic goods exported but subsequently readmitted, are included. The bunkering of fuel outside the reference territory by national merchant ships and civil aircraft engaged in international travel is excluded from imports. Fuels delivered to national merchant ships and civil aircraft which are outside of the national territory and are engaged in international travel should be classified as "international marine" or "aviation bunkers", respectively, in the country where such bunkering is carried out. Note that the "country of origin" of energy products should be recorded as a country from which goods were imported.

Exports of energy products comprise all fuel and other energy products leaving the national territory with the exception that exports exclude quantities of fuels delivered for use by merchant (including passenger) ships and civil aircraft, of all nationalities, during international transport of goods and passengers. Goods simply being transported through a country (goods in transit) and goods temporarily withdrawn are excluded but re-exports, foreign goods exported in the same state as previously imported, are included. Fuels delivered to foreign merchant ships and civil aircraft engaged in international travel are classified as "international marine" or "aviation bunkers", respectively. Note that "country of destination" of energy products (that is country of the last known destination as it is known at the time of exportation) should be recorded as a

country to which these products are exported to.

Quantities of crude oil and products imported or exported under processing agreements (i.e. refining on account) should be included. Crude oil and NGLs should be reported as coming from the economy of ultimate origin; refinery feedstocks and finished products should be reported as coming from the economy of last consignment. Any gas liquids (e.g. LPG) extracted during the regasification of imported liquefied natural gas should be included as imports. Petroleum products imported or exported directly by the petrochemical industry should be included.

Note: Imports or exports of ethanol (reported in the Additives/Oxygenate column) should relate to the quantities destined for fuel use.

- Re-exports of oil imported for processing within bonded areas should be included as an export of product from the processing economy to the final destination.

3. International marine bunkers

International marine bunkers are quantities of fuels delivered to merchant (including passenger) ships, of any nationality, for consumption during international voyages transporting goods or passengers. International voyages take place when the ports of departure and arrival are in different national territories. Fuels delivered for consumption by ships during domestic transportation, fishing or military uses are not included here. For the purposes of energy statistics, International marine bunkers are not included in exports. Consumption of warships should be included in final consumption under other sector, not elsewhere specified. Consumption by ships engaged in fishing and in transport in inland and coastal waters is not included.

4. International aviation bunkers

International aviation bunkers are quantities of fuels

delivered to civil aircraft, of any nationality, for consumption during international flights transporting goods or passengers. International flights take place when the ports of departure and arrival are in different national territories. Fuels delivered for consumption by aircraft undertaking domestic or military flights are not included here. Fuels used by airlines for their road vehicles are excluded. The domestic/international split should be determined on the basis of departure and landing locations and not by the nationality of the airline.

5. Stock changes

Stocks are quantities of energy products that can be held and used to: (a) maintain service under conditions where supply and demand are variable in their timing or amount due to normal market fluctuations, or (b) supplement supply in the case of a supply disruption. Stocks used to manage a supply disruption may be called "strategic" or "emergency" stocks and are often held separately from stocks designed to meet normal market fluctuations. Stock changes are defined as the increase (stock build) or decrease (stock draw) in the quantity of stock over the reporting period. They are calculated as a

difference between the opening and closing stocks.

6. Transfers

This refers to products transferred and inter-product transfers. *Product transferred* refers to the reclassification (renaming) of products which is necessary when finished oil products are used as feedstock in refineries. *Interproduct transfers* refer to the movements of fuels between product categories because of reclassification of a product which no longer meets its original specification. The transferred product is often blended with its host. For example, quantities of kerosene may be reclassified as gas oil after blending with the latter in order to meet its winter diesel specification.

7. Statistical difference

This is the difference between calculated and observed gross inland deliveries. National Administrations sometimes obtain the data components of domestic availability from a variety of sources. Owing to differences in concepts, coverage, timing and definitions, observed and calculated gross inland deliveries are often not identical.

Transformation sector

Transformation is the process where the movement of part or all of the energy content of a product entering a process to one or more different products leaving the process (e.g. coking coal to coke, crude oil to petroleum products, and heavy fuel oil to electricity). The transformation can take place in various plants including: electricity plants, combined heat and power plants, heat plants, blast furnace/gas works, coke/patent fuel/BKB plants, petroleum refineries, petrochemical industry, liquefaction plants, and other plants.

1. Electricity plants

Electricity plants refer to plants producing only electricity. The electricity may be obtained directly from natural sources such as hydro, geothermal, wind, tidal, marine, solar energy or from fuel cells or from the heat obtained from the combustion of fuels or nuclear reactions.

2. Combined heat and power plants (CHP)

Combined heat and power plants refer to plants which produce both heat and electricity from at least one generating unit in the plant. They are sometimes

referred to as “co-generation” plants. Both main activity producer (formerly known as public) and autoproducer plants are included here.

3. Heat plants

Heat plants refer to plants (including heat pumps and electric boilers) designed to produce heat only for deliveries to third party. Both main activity producer (formerly known as public) and autoproducer plants are included here. Deliveries of fuels for heat generated by an establishment for its own use are classified within the part of final consumption where they are consumed.

4. Blast furnaces

Blast furnaces are furnaces which produce blast furnace gas as a by-product when making pig iron from iron ore. During the process, carbon, mainly in the form of coke, is added to the blast furnace to support and reduce the iron oxide charge and provide heat. Blast furnace gas comprises carbon monoxide and other gases formed during the heating and reduction process.

5. Gas works

Gas works plants are for the production of town gas/gas work gas by carbonisation (including gas produced by coke ovens and transferred to gas works gas), by total gasification with or without enrichment with oil products (LPG, residual fuel oil, etc.) and by reforming and simple mixing of gases and/or air.

6. Coke ovens

Coke ovens are facilities for the carbonisation of coal, principally coking coal, at high temperature. The transformation process provide for the production of coke and by-products such as coke oven gas and coal tar.

7. Patent fuel plants

Patent fuel plants are for the manufacturing of a composition fuel made of hard coal fines and addition of a binding agent.

8. BKB plants

BKB (brown coal briquettes) plants are for the manufacturing of a composition fuel made of lignite/brown coal (including dried lignite fines and dust) produced by briquetting under high pressure without the addition of a binding agent. This includes peat briquettes plants which produce a similar composition fuel using peat.

9. Petroleum refineries

Petroleum refineries are industrial plants which transform crude oil and other hydrocarbons into finished oil products. Typical finished products are liquefied petroleum gases, naphtha, motor gasoline, gas oils, aviation fuels and other kerosene, and fuel oils.

10. Petrochemical industry

Petrochemical industries are industrial plants which convert hydrocarbon feedstock into organic chemicals, intermediate compounds and finished products such as plastics, fibres, solvents and surfactants. Feedstock used by the plant is usually obtained from the refinery and includes naphtha, ethane, propane and middle distillate oils (for example, gas oil). Quantities of backflows or petroleum products returned from the petrochemical sector, whether returned to refineries for further processing/blending or used directly. Note: energy use in the petrochemical sector is reported in the Energy sector, non-energy use is shown in the chemical/petrochemical industrial sector as non-energy.

11. Liquefaction plants

Liquefaction plants include diverse liquefaction

processes, such as coal liquefaction plants and gas-to-liquid plants. Coal liquefaction plants are facilities where coal is used to produce liquid fuels suitable for transportation applications by the removal of carbon or addition of hydrogen, either directly or indirectly.

12. Natural gas blending plants

These are plants, separate from gas works, in which substitute natural gas, petroleum gases or biogases are mixed with natural gas for distribution in the gas mains. Where blending of substitute natural gas with natural gas takes place within gas works the blending

is considered part of the gas works process.

13. Charcoal production plants

Charcoal plants are facilities in which wood or other vegetal matter is carbonised through slow pyrolysis to produce charcoal.

14. Other transformation plants

Other transformation plants represent other energy transformation processes not already covered by the list of definition.

Energy sector

The energy sector covers ISIC Divisions 05, 06, 19 and 35. The energy sector includes the manufacture of chemical materials for atomic fission and fusion and the products of these processes. Fuels used in the manufacture of fuel briquettes and packaged fuel from coal or lignite and consumption in coke ovens and other transformation industries should also be reported here.

The energy sector is divided into the following sub-sectors: coal mines, patent fuel plants, coke ovens, gas work plants, natural gas blending plants, blast furnaces, BKB/PB plants, petroleum refineries, electricity, CHP and heat plants, liquefaction plants,

not elsewhere specified and distribution losses.

Fuels used by the energy industry to support the extraction (mining, oil and gas production) or transformation activity are reported in this category. For example: fuel used for heating, lighting, or operating pumps/compressors, or used as inputs fuel into furnaces or ovens. Note that quantities of fuels transformed into another energy form should be reported under the transformation sector. Consumption used in support of the operation of pipelines (oil, gas and coal slurry) should be reported in the transport sector.

Final energy consumption sector

The term final energy consumption (equal to the sum of the consumption in the end-use sectors: industry, transport, residential, commercial/public services, agriculture/ forestry, fishing and non-specified) implies that energy used for transformation and for own use of the energy producing industries is excluded. Final consumption reflects for the most part deliveries to consumers. It does not include consumption for non-energy purposes.

1. Industry sector

Industry sector covers all industrial undertakings as enumerated below. Sectors included are iron and steel; chemical including petrochemical; non-ferrous metals; non-metallic mineral products; transport equipment; machinery; mining (excluding energy producing industries) and quarrying; food processing, beverages and tobacco; pulp, paper and printing; wood and wood products (other than pulp

and paper); construction; textile and leather; not elsewhere specified.

1.1 Iron and steel

Covers ISIC Group 241 and Class 2431. The consumption in coke ovens and blast furnaces are defined as part of transformation processes and energy industry own use.

1.2 Chemical including petrochemical

Refers to ISIC Division 20 and 21, excluding ISIC 2011. The consumption by plants manufacturing charcoal or enrichment/production of nuclear fuels is excluded, as these plants are considered part of the energy industries.

- Includes manufacture of basic chemicals, fertilisers and nitrogen compounds, plastics and synthetic rubber in primary forms (ISIC 201)
- Other chemical products (ISIC 202), Man-made fibers (ISIC 203)

1.3 Non-ferrous metals

Refers to ISIC Group 242 and Class 2432.

- Manufacture of precious and non-ferrous metals (ISIC 242)
- Casting of non-ferrous metals (ISIC Class 2432)

1.4 Non-metallic minerals products

Covers ISIC Division 23, i.e.: Glass, ceramic, cement and other building materials industries.

- Manufacture of glass and glass products (ISIC 231)
- Non-metallic mineral products (ISIC 239) such as ceramics, tiles, baked clay products and cement

1.5 Transport equipment

Covers ISIC Division 29 and 30, i.e.:

- Manufacture of motor vehicles (ISIC 291) bodies for motor vehicles and semi-trailers (ISIC 292)
- Manufacture of parts and accessories for motor

vehicles (ISIC 293)

- Building of ships and boats (ISIC 301)
- Manufacture of railway locomotives and rolling stock (ISIC 302)
- Manufacture of air and spacecraft and related machinery (ISIC 303)
- Manufacture of transport equipment not elsewhere classified (ISIC 309)

1.6 Machinery

Refers to Fabrication of metal products, machinery and equipment other than transport equipment. ISIC Division 25, 26, 27 and 28.

Includes manufacture of:

- Structural metal products, tanks, reservoirs and steam generators (ISIC 251)
- Weapons and ammunition (ISIC 252)
- Other fabricated metal products; metalworking service activities (ISIC 259)
- Electronic components and boards (ISIC 261)
- Computers and peripheral equipment (ISIC 262)
- Communication equipment (ISIC 263)
- Consumer electronics (ISIC 264)
- Measuring, testing, navigating and control equipment; watches and clocks (ISIC 265)
- Irradiation, electromedical and electrotherapeutic equipment (ISIC 266)
- Optical instruments and photographic equipment (ISIC 267)
- Magnetic and optical media (ISIC 268)
- Electric motors, generators and transformers and electricity distribution and control apparatus (ISIC 271)
- Batteries and accumulators (ISIC 272)
- Wiring and wiring devices (ISIC 273)
- Electric lighting equipment (ISIC 274)
- Domestic appliances (ISIC 275)
- Other electrical equipment (ISIC 279)
- General purpose machinery (ISIC 281)
- Special purpose machinery (ISIC 282)

1.7 Mining (excluding energy producing industries) and quarrying

Refers to ISIC Divisions 13 and 14, i.e.:

- Mining of iron ores (ISIC 131)
- Mining of non-ferrous metal ores (ISIC 132)
- Quarrying of stone, sand and clay (ISIC 141)
- Mining and quarrying not elsewhere classified (ISIC 142)

1.8 Food, beverages and tobacco

Refers to ISIC Division 10, 11 and 12, i.e.:

- Processing and preserving of meat, fish, crustaceans and molluscs, fruit and vegetables (ISIC 101, 102, 103)
- Manufacture of vegetable and animal oils, fats, dairy products (ISIC 104, 105)
- Manufacture of grain mill products, starches and starch products (ISIC 106)
- Manufacture of other food products (ISIC 107)
- Manufacture of prepared animal feeds (ISIC 108)
- Manufacture of beverages (ISIC 110)
- Manufacture of tobacco products (ISIC 120)

1.9 Pulp, paper and printing

Refers to ISIC Division 17 and 18. Includes production of recorded media.

- Manufacture of paper and paper products (ISIC 170)
- Printing and service activities related to printing (ISIC 181)
- Reproduction of recorded media (ISIC 182)

1.10 Wood and wood products (other than pulp and paper)

Refers to ISIC Division 16, i.e.:

- Sawmill and planing of wood (ISIC 161)
- Manufacture of products of wood, cork, straw and plaiting materials (ISIC 162)

1.11 Construction

Refers to ISIC Division 41, 42 and 43, i.e.:

- Construction of buildings (ISIC 410)
- Construction of roads and railways (ISIC 421)
- Construction of utility projects (ISIC 422)
- Construction of other civil engineering projects (ISIC 429)
- Demolition and site preparation (ISIC 431)
- Electrical, plumbing and other construction installation activities (ISIC 432)
- Building completion and finishing (ISIC 433)
- Other specialised construction activities (ISIC 439)

1.12 Textile and leather

Refers to ISIC Divisions 13, 14 and 15, i.e.:

- Spinning, weaving and finishing of textiles (ISIC 131)
- Manufacture of other textiles (ISIC 139)
- Manufacture of wearing apparel except fur apparel (ISIC 141)
- Manufacture of articles of fur (ISIC 142)
- Manufacture of knitted and crocheted fabrics and apparel (ISIC 143)
- Tanning and dressing of leather; manufacture of luggage, handbags, saddlery and harness; dressing and dyeing of fur (ISIC 151)
- Manufacture of footwear (ISIC 152)

1.13 Not elsewhere specified

If your economy's industrial classification does not correspond to the above ISIC, please estimate the breakdown by industry and include in "not elsewhere specified" only consumption in sectors which is not covered above. This covers ISIC Division 22, 31 and 32, i.e.: manufacture of

- Rubber products (ISIC 221)
- Plastic products (ISIC 222)
- Furniture (ISIC 310)
- Jewellery, bijouterie and related articles (ISIC 321)
- Musical instruments (ISIC 322)

- Sports goods (ISIC 323)
- Games and toys (ISIC 324)
- Medical and dental instruments and supplies (ISIC 325)
- Others manufacturing not elsewhere classified (ISIC 329)

2. Transport sector

All transport activities irrespective of the economic sector in which the activity occurs. Refers to ISIC Divisions 49, 50 and 51.

2.1 Domestic air transport

Refers to domestic aircraft - commercial, private, agricultural, etc. include oil used for purposes other than flying, e.g. bench-testing of engines. Military use of aviation fuels also should be excluded here.

2.2 Road

Transport by road vehicles. It includes agricultural highway use, but excludes motor gasoline used in stationary engines (included in the other sector) and diesel oil for non-highway use in tractors (included in agriculture). Lubricants for use in road vehicles should be included here. Bitumen for use in road surfacing and gas oil used in engines at construction sites should not be included here but should be included in the industry subsector "construction" below.

2.3 Rail

Refers to rail traffic, including industrial railways.

2.4 Inland waterways

Refers to water vessels navigating in inland waterways and coastal shipping. For example: small craft, barges, and those coastal ships which do not travel for international transportation.

2.5 Pipeline transport

Refers to transport of goods through pipelines.

2.6 Not elsewhere specified

Transport activities not included elsewhere.

3. Other sector

Other sector covers commercial and public services, residential, agriculture, fishing and other final consumption not elsewhere classified.

3.1 Commercial and public services

These refer to business and offices in the public and private sectors. ISIC Divisions 01, 02, 03, 33, 36-39, 45-99, ISIC Class 8422.

3.2 Residential

Refers to all households including "households with employed persons." ISIC Division 97 and 98.

3.3 Agriculture

Refers to agriculture, hunting and forestry by ISIC as follows: ISIC Divisions 01 and 02.

3.4 Fishing

Refers to aquaculture and fisheries, covering the use of fishery resources from marine, brackish or freshwater environments, with the goal of capturing or gathering fish, crustaceans, molluscs and other marine organisms and products (e.g. aquatic plants, pearls, sponges, etc.) Also included are activities that are normally integrated in the process of production for own account (e.g. seeding oysters for pearl production). ISIC Division 03.

3.5 Not elsewhere specified

Report activities not included elsewhere, please specify. This category includes military use.

3.6 Non-energy use

Refers to use of energy products as raw materials in the different sectors; that is, not consumed as a fuel or transformed into another fuel. Example: in industry, coal used to make methanol or ammonia.

This is further classified into:

- **Chemical (incl. the petrochemical sector):**
Non-energy use of coal includes uses as feedstocks to produce fertiliser and as feedstocks for other petrochemical products.

- **Transport sector:** Non-energy use in all transport sub sectors.
- **Other sector:** Non-energy use in commercial and public services, residential, agriculture and not elsewhere specified.

C. Energy prices

Energy prices are in either local currency units or in US dollars.

Table 1. Import prices

These are import prices based on CIF. These prices are obtained by dividing the value by the volume in foreign trade. Value and volume are recorded by customs administrations for each tariff position. Values recorded at the import stage include cost, insurance and freight (CIF) but exclude import duties.

These are import prices of coal and coal products; crude oil, NGL and petroleum products; electricity and other products including biofuels and other renewable energy products.

The average local currency exchange rate to the US dollar and local currency unit are also required in this table.

Table 2. Wholesale prices

Table 2 contains wholesale prices. These are the

prices that a buyer pays for large volume purchases whether for own consumption or retail. Examples are prices paid by electricity distribution companies to electricity generators or suppliers.

Prices are either in local currency units or in US dollars.

Table 3. Consumer prices

These are the prices paid by end-use consumers such as motorists buying fuel in filling stations, household electricity bills, coal briquette prices in supermarkets, etc. The prices may also be in local currency units or in US dollars.

Electricity prices are prices charged to the industrial, commercial, residential rates and rates to other consumers. Commercial sector include the government services and streetlights. Others include agriculture and other sectors not included in industrial, commercial and residential.

D. Definition of columns and rows of the energy balance table

1. Unit

For the purpose of presenting its energy balances APEC has adopted kcal and Joules. 10^7 kcal (41.868 gigajoules) is equivalent to one ton of oil equivalent (toe). This quantity of energy is, within a few percent, equal to the net heat content of one ton of crude oil.

2. Conversion (from original to TOE)

The Coordinating Agency has adopted specific factors supplied by the member economies for each flow or use. The balances are expressed in term of "net" heat value. The difference between the "net" and "gross" heat value for each fuel is the latent heat

in condensation of the water vapor produced during combustion of the fuel. For coal and oil, net heat value is 5 percent less than gross, for most forms of natural and manufactured gas the difference is 9-10 percent, while for electricity there is no difference. The use of net heat value is consistent with the practice of the Statistical Offices of the European Communities and the United Nations.

3. Layout

The energy balances are presented in tabular format: columns for the various sources of energy and rows for the different origins and uses.

Columns

Across the top of the table from left to right, there are thirteen columns with the following headings:

Column 1: Coal includes all primary coal, such as anthracite, coking coal, other bituminous coal, sub-bituminous coal, lignite and peat.

Column 2: Coal products includes all fuels derived from coal including patent fuel, coke oven coke, gas coke, briquettes, coal tar, coke oven gas, blast furnace gas and oxygen steel furnace gas.

Column 3: Crude Oil comprises crude oil, refinery feedstocks and natural gas liquids. Natural LPG is included in LPG.

Columns 4 and 4.1 to 4.10: Petroleum products (column 4) comprises motor gasoline, naphtha, jet fuel, kerosene, gas/diesel oil, residual fuel oil, LPG, refinery gas, ethane and other petroleum products such as: aviation gasoline, white spirit, lubricants, bitumen, paraffin waxes and petroleum coke (columns 4.1 to 4.10). The definitions of these products are in Appendix A.

Column 5: Gas includes natural gas and LNG (excluding natural gas liquids).

Column 6: Hydro shows the energy content of the electricity produced in hydro power plants. Hydro output includes output from pumped storage plants.

Column 7: Nuclear shows the primary heat equivalent of the electricity produced by a nuclear power plant with an average thermal efficiency of 33 percent.

Column 8: Geothermal, solar, etc. shows the primary heat equivalent of the electricity produced in geothermal plants with an average thermal efficiency of 10 percent, and the energy content of electricity produced in non-thermal power plants such as photovoltaic, wind, tide wave etc.

Column 9: Others includes wood, wood waste, black liquor, industrial and municipal waste and biomass (power generation from other fuel sources such as defined in "others" is included here).

Column 10: Electricity shows final consumption and trade in electricity (which is accounted at the same heat value as electricity in final consumption; i.e. 1 GWh = 0.000086 Mtoe).

Column 11: Heat includes heat production from

public combined heat and power plants (CHP), from autoproducer's heat that is sold to a third party (e.g. to a network).

Column 12: Total = the total of columns 1 to 11.

Rows

The categories on the left hand side of the table have the following functions.

Row 1: Indigenous production shows only production of primary energy, i.e. hard coal, lignite, crude oil, NGL, natural gas, hydro and nuclear, geothermal, etc. electricity and others.

Row 2/3: Imports and exports comprise amounts having crossed the boundaries of the economy whether or not customs clearance has taken place.

Row 4/5: International marine and aviation bunkers cover those quantities delivered to sea-going ships and international flights of all flags. Consumption by ships and planes engaged in transport in inland and coastal waters is not included.

Row 6: Stock changes are treated as follows: a decrease in stocks, shown in the table as a positive number, is added to supply and an increase in stocks, shown as a negative number, is deducted from supply. Producers', importers', energy transformation industries' and large users' stocks are included.

Row 7: Total primary energy supply (TPES) are made up of *indigenous production (row 1) + imports (row 2) – exports (row 3) – international marine and aviation bunkers (row 4/5) and ± stock changes (row 6)*.

Row 8: Transfers refer to interproduct transfers, product transferred, liquid products from gas separation and recycled products as defined in Appendix B.

Row 9: Total transformation sector is made up of

main activity producer (row 10) + autoproducers (row 11) + gas processing (row 12) + petroleum refineries (row 13) + coal transformation (row 14) + other transformation (row 15).

Row 10: Main activity producer, column 1 to 9 show primary and secondary fuel input to public utilities' plants as negative entries. Gross electricity produced (including power stations' own consumption) appears as a positive quantity in column 11, "electricity". Transformation losses appear in the "total", column 12, as a negative number.

Row 11: Autoproducers, columns 1 to 9 show primary and secondary fuel input to electricity generation of autoproducers as negative entries. An autoproducer is an establishment which, in addition to its main activities, generates electricity wholly or partially for its own use, such as industries, railways, refineries etc. Total gross electricity produced appears as a positive quantity in column 10, "electricity". Transformation losses appear in the "total", column 12 as a negative number.

Row 12: Where there is a production of gas at gas-to-liquid facilities, the treatment is similar to that for electricity generation, with the quantity produced appearing as a positive figure in column 5 "gas", input as negative entries in column 1 (coal), 2 (coal products), 4 (petroleum products) and 5 (natural gas input) and conversion losses appearing in the "total" column.

Row 13: The row petroleum refineries shows the

transformation of crude oil, NGL and condensate to petroleum products.

Row 14: Coal transformation shows the transformation of coal from primary to secondary fuels and from secondary to tertiary fuels (hard coal to coke, coke to blast furnace gas, brown coal to BKB, etc.)

Row 15: Other transformation: contains the energy feedstocks and outputs of petrochemical industry, biofuel processing, charcoal processing and other transformation processes that are not classified elsewhere.

Row 16: Loss & own use: own use contains the primary and secondary energy consumed by transformation industries for heating, traction and lighting purposes. These are shown as negative figures. Included here are, for example, the coal mines' own use of energy, energy use in refineries, electricity plants' own consumption (which includes gross electricity consumed for pumped storage), and energy used for oil and gas extraction (which also includes consumption for the pipeline system). Loss include losses in gas distribution, electricity transmission, and coal transport.

Row 17: Discrepancy is a category which includes the sum of the unexplained statistical differences for individual fuels.

Row 18: Total final consumption (TFC) is the sum of total final energy consumption (TFEC) in row 19 and non-energy use in row 36.

Row 19: Total final energy consumption (TFEC) is the sum of consumption by the different end-use sectors (row 20, 25, 31).

Row 20: Consumption of the industry sector (energy used for transport by industry is not included here but reported under transport).

Row 21: Iron and steel covers ISIC Group 241 and

Class 2431. Report pulverised coal injection (PCI) into blast furnaces under blast furnaces, Transformation sector. To avoid double counting, fuels used in blast furnaces should be reported in the transformation sector.

Row 22: Chemical & petrochemical refers to ISIC Division 20 and 21.

Includes manufacture of basic chemicals (ISIC 201)

Other chemical products (ISIC 202), Man-made fibers (ISIC 203)

Row 23: Non-metallic minerals covers ISIC Division 23, i.e.: Glass, ceramic, cement and other building materials industries.

Manufacture of glass and glass products (ISIC 231)

Non-metallic mineral products (ISIC 239) such as ceramics, tiles, baked clay products and cement

Row 24: Other industries cover consumption of all other manufacturing industries, mining, quarrying and constructions.

Row 25: The transport sector includes all fuels for transport, except international marine bunkers. It includes transport in the industry sector and covers road, railway, domestic air transport, inland waterways (including small craft, fishing vessels and coastal shipping not included under marine bunkers) and non-specified transport.

Row 26: Domestic air transport refers to domestic aircraft - commercial, private, agricultural, etc. include oil used for purposes other than flying, e.g. bench-testing of engines. Military use of aviation fuels also should be excluded here.

Row 27: Road covers transport by road vehicles. It includes agricultural highway use, but excludes motor gasoline used in stationary engines (included in the other sector) and diesel oil for non-highway use in tractors (included in agriculture). Lubricants

for use in road vehicles should be included here. Bitumen for use in road surfacing and gas oil used in engines at construction sites should not be included here but should be included in the industry subsector "construction".

Row 28: Rail refers to rail traffic, including industrial railways.

Row 29: Inland waterways refers to water vessels navigating in inland waterways and coastal shipping. For example: small craft, barges, and those coastal ships which do not travel for international transportation.

Row 30: Non-specified transport covers pipeline transport and other transport activities not included elsewhere.

Row 31: Other sectors cover agriculture, residential, commercial and public services and non-specified consumption.

Row 32: Refers to all households including "households with employed persons." ISIC Division 97 and 98.

Row 33: These refer to business and offices in the public and private sectors.

Row 34: Consumption of the agriculture sector.

Row 35: Other shows non-specified use which may include military use.

Row 36: Non-energy use covers use of coal, gas and petroleum products such as white spirit, paraffin waxes, lubricants, bitumen and other products. Petroleum coke is shown as non-energy use only when there is evidence of such use; otherwise it is shown under energy use in industry or other sectors. This covers all oil including naphtha, except the other petroleum products listed above, and gas used as petrochemical feedstock. Gas used as raw material for chemical products such as methanol and ammonia/urea is also included.

E. Conversion factors

1. Coal

Coal has separate factors for production, imports, exports, inputs to power plants, coal used in coke ovens, and coal used in industry. Each economy's individual conversion factors are applied.

2. Crude oil

The conversion factors of each economy are applied as shown in the table of conversion factors.

3. Petroleum products

The conversion factors of each economy are applied.

4. Gas

To convert the gross heat content of a gas to its net heat content, the following multiplying factors were used:

Natural gas	0.9
Gas works gas	0.9
Coke oven gas	0.9
Blast furnace gas	1.0

5. Electricity

Figures for electricity production, trade, and final consumption are calculated using the energy content of the electricity, i.e. at a rate of 1 TWh = 0.086 Mtoe. Hydro-electricity production (excluding pumped storage) and electricity produced by other non-

thermal means (wind, tide, photovoltaic, etc.) are accounted for similarly using 1 TWh = 0.086 Mtoe. However, the primary energy value ascribed to nuclear power plants is calculated from the gross generation by assuming that only 33% of the primary energy content appears as electricity, i.e. 1 TWh = (0.086/0.33) Mtoe. In the case of electricity produced from geothermal heat the primary value is calculated using 1 TWh = (0.086/0.1) Mtoe.

6. Heat

Information on heat is supplied in net kilocalories. 10¹⁰ kilocalories = 1 ktoe

7. Others

The conversion factors used for other energy, such as wood, wood waste, black liquor, etc. are those that are provided by each economy. In cases where the member economies cannot provide a conversion factor, the CA used the following net calorific values:

Fuel wood and wood waste	3 702 kcal/kg
Bagasse	1 959 kcal/kg
Charcoal	6 898 kcal/kg
Industrial waste	3 344 kcal/kg
Municipal solid waste	3 344 kcal/kg
Other biomass	2 986 kcal/kg
